Manuscript received August 17, 2000 Accepted for publication January 17, 2001

### ABSTRACT

Recent advances in molecular genetic techniques will make dense marker maps available and genotyping many individuals for these markers feasible. Here we attempted to estimate the effects of ~50,000 marker haplotypes simultaneously from a limited number of phenotypic records. A genome of 1000 cM was simulated with a marker spacing of 1 cM. The markers surrounding every 1-cM region were combined into marker haplotypes. Due to finite population size ( $N_e = 100$ ), the marker haplotypes were in linkage disequilibrium with the QTL located between the markers. Using least squares, all haplotype effects could not be estimated simultaneously. When only the biggest effects were included, they were overestimated and the accuracy of predicting genetic values of the offspring of the recorded animals was only 0.32. Best linear unbiased prediction of haplotype effects assumed equal variances associated to each 1-cM chromosomal segment, which yielded an accuracy of 0.73, although this assumption was far from true. Bayesian methods that assumed a prior distribution of the variance associated with each chromosome segment increased this accuracy to 0.85, even when the prior was not correct. It was concluded that selection on genetic values predicted from markers could substantially increase the rate of genetic gain in animals and plants, especially if combined with reproductive techniques to shorten the generation interval.

# SNP-based heritability ( $h^2$ )

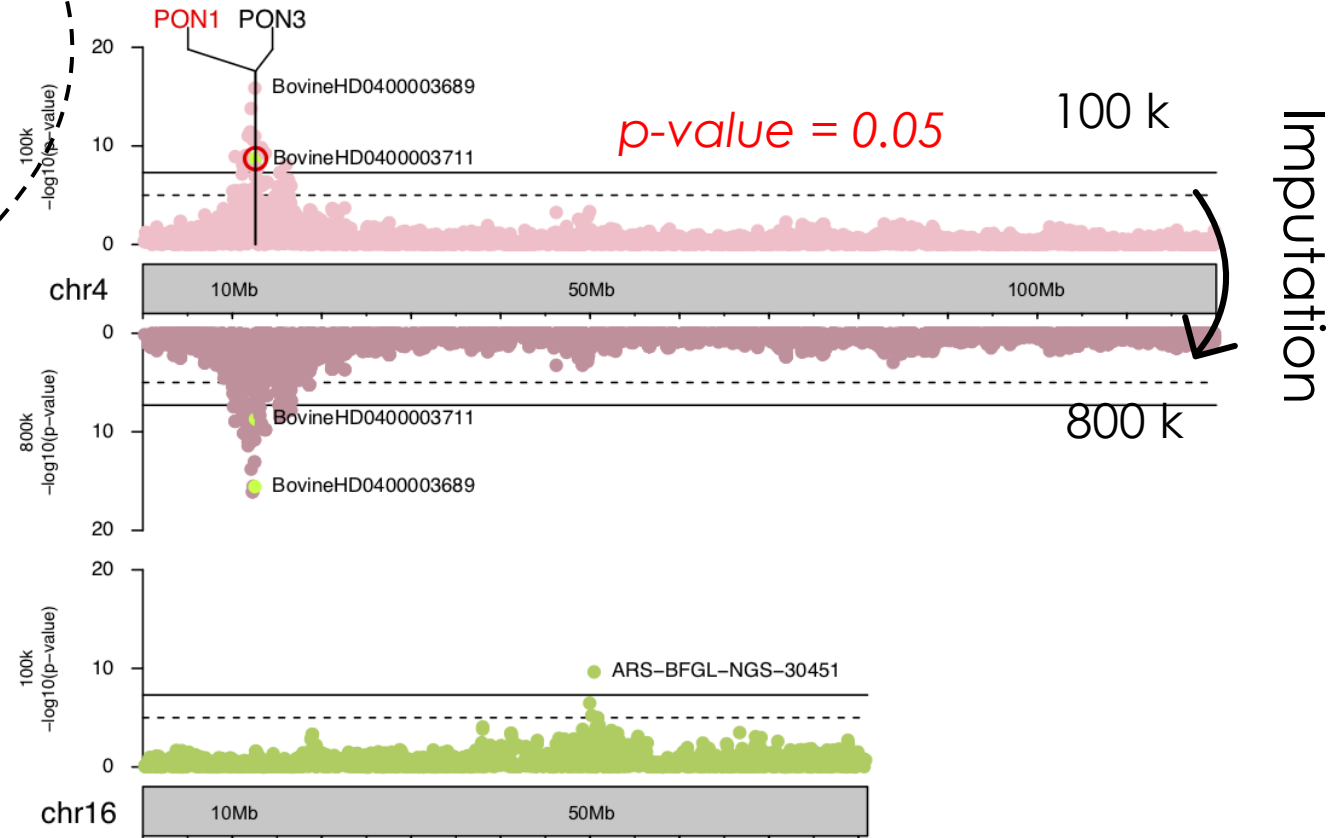

# Paraoxonase

Haplotype-based:

Passamonti et al., Journal of Dairy Science 2024, in press

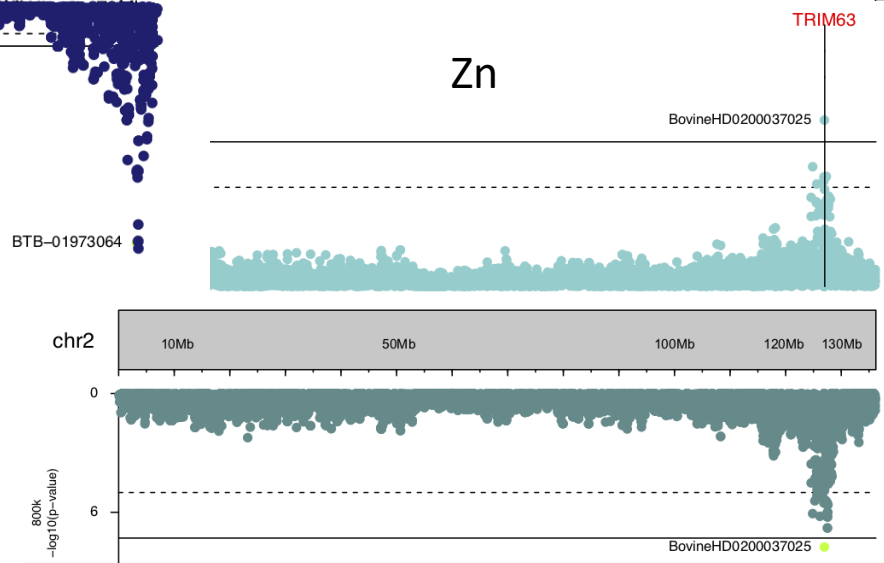

- Paraoxonase protects HDL from oxidation (*Aviram et al., 2000*)
- Low levels of paraoxonase associated with **higher inflammation** in dairy cows (*Bionaz et al., 2007*)
- In mice, **SNPs in PON1 gene** were associated with **different susceptibility to oxidative stress** (*Deakin and James, 2004*)

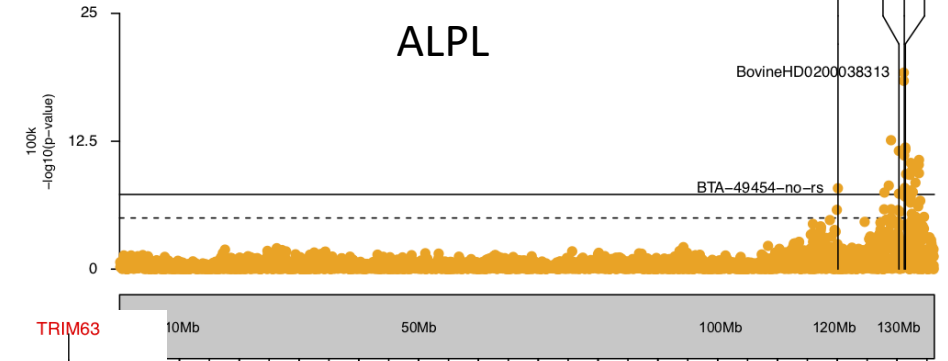

## GGT

- GGT is involved in the cycle of glutathione (anti-oxidant) (*Kunutsor et al., 2016*)
- GGT1 gene expression is increased by oxidative stress (adaptive response?) (*Zhang et al., 2005*)

## Zn

- Codes for a zinc finger protein (MuRF-1)
- MuRF-1 is involved in the breakdown of skeletal muscle proteins, then degraded into peptides and supplied to other tissues (adaptation to negative protein balance condition in dairy cows?) (*Kuhla et al., 2011*)

## ALPL

- Codes for endothelyn
  - Endothelyn is involved in proliferation of hepatic stellate cells
  - Increased ECE1 expression associated with liver injury (*Cho et al., 2019*)
- ECE1* gene associate with blood ALP concentration in humans (*Monti et al., 2022*)

# Nuovi approcci

# Landscape genomics

Comprendere i **meccanismi molecolari** che sottendono l'**adattamento degli animali domestici alle variazioni ambientali** è un fattore chiave per lo sviluppo di un'agricoltura "climate-smart".

La "Landscape genomics" cerca di spiegare il pattern spaziale di distribuzione della variabilità genetica in relazione all'**adattamento locale** all'ambiente (Joost et al., 2003).

# Landscape genomics
